

CLEC12A Antibody (Center)

Affinity Purified Rabbit Polyclonal Antibody (Pab) Catalog # AP10037c

Product Information

Application WB, E **Primary Accession** Q5QGZ9

Other Accession NP 612210.4, NP 963917.2

Reactivity Human
Host Rabbit
Clonality Polyclonal
Isotype Rabbit IgG
Calculated MW 30762
Antigen Region 178-206

Additional Information

Gene ID 160364

Other Names C-type lectin domain family 12 member A, C-type lectin-like molecule 1, CLL-1,

Dendritic cell-associated lectin 2, DCAL-2, Myeloid inhibitory C-type lectin-like

receptor, MICL, CLEC12A, CLL1, DCAL2, MICL

Target/SpecificityThis CLEC12A antibody is generated from rabbits immunized with a KLH

conjugated synthetic peptide between 178-206 amino acids from the Central

region of human CLEC12A.

Dilution WB~~1:1000 E~~Use at an assay dependent concentration.

Format Purified polyclonal antibody supplied in PBS with 0.09% (W/V) sodium azide.

This antibody is purified through a protein A column, followed by peptide

affinity purification.

Storage Maintain refrigerated at 2-8°C for up to 2 weeks. For long term storage store

at -20°C in small aliquots to prevent freeze-thaw cycles.

Precautions CLEC12A Antibody (Center) is for research use only and not for use in

diagnostic or therapeutic procedures.

Protein Information

Name CLEC12A {ECO:0000303 | PubMed:16838277,

ECO:0000312 | HGNC:HGNC:31713}

Function Myeloid inhibitory C-type lectin receptor that acts as a negative regulator of

myeloid cell activation (PubMed: 14739280, PubMed: 15238421,

PubMed: 16239426, PubMed: 34234773, PubMed: 38367667, PubMed:38386511, PubMed:39143217). Myeloid cell inhibition is required to limit proinflammatory pathways and protect against excessive inflammation (By similarity). Specifically recognizes and binds various structures, such as neutrophil extracellular traps (NETs) or monosodium urate crystals (PubMed:38367667, PubMed:38386511, PubMed:39143217). Also acts as a pattern-recognition receptor for pathogen-associated molecules, such as plasmodium hemozoin or mycobacterial micolic acid (PubMed:31269448, PubMed: 36542980). Ligand-binding induces phosphorylation of its ITIM motif, followed by recruitment of tyrosine- protein phosphatases PTPN6 and PTPN11, which counteract tyrosine- protein kinase SYK, thereby preventing myeloid cell activation (PubMed: 14739280, PubMed: 16239426, PubMed:34234773). Acts as a pattern-recognition receptor for NETs in neutrophils: specifically recognizes DNA in NETs, leading to inhibit neutrophil activation and limit further NET formation (PubMed:39143217). This regulation is essential for controlling key neutrophil responses and limit NET-mediated inflammatory conditions (By similarity). Also recognizes dead cells by acting as a receptor for monosodium urate crystals, leading to downregulate neutrophil activation (PubMed:38367667, PubMed:38386511). Binding to monosodium urate crystals also promotes the type I interferon response (By similarity). Acts as an inhibitor of natural killer (NK) cell cytotoxicity (PubMed:15238421). Also acts as an ihibitor of dendritic cell maturation in an IL10-dependent manner (PubMed:16239426).

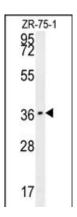

Cellular Location

Cell membrane; Single-pass type II membrane protein. Note=Ligand binding leads to internalization (PubMed:16239426). Clusters at phagocytic vesicles upon monosodium urate crystal-binding (PubMed:38367667)

Tissue Location

Preferentially expressed in lymphoid tissues and immune cells, including natural killer (NK) cells, T-cells, dendritic cells and monocytes or macrophages (PubMed:14739280, PubMed:15238421, PubMed:15548716, PubMed:16239426, PubMed:16838277). Detected in spleen macrophage-rich red pulp and in lymph node (at protein level) (PubMed:16838277). Detected in peripheral blood leukocytes, dendritic cells, bone marrow, monocytes, mononuclear leukocytes and macrophages (PubMed:16838277).
