Immunogen KLH conjugated synthetic peptide derived from human ROCK2

Epitope Specificity 1001-1300/1388

Isotype IgG

Purity affinity purified by Protein A

Buffer 0.01M TBS (pH7.4) with 1% BSA, 0.02% Proclin300 and 50% Glycerol.

SUBCELLULAR LOCATION Cytoplasm. Cell membrane. Cytoplasmic, and associated with actin

microfilaments and the plasma membrane.

SIMILARITY Belongs to the protein kinase superfamily. AGC Ser/Thrprotein kinase family.

Contains 1 AGC-kinase C-terminal domain. Contains 1 PH domain.

SUBUNIT Homodimer. Interacts with IRS1, RHOB and RHOC. Interacts with RHOA

(activated by GTP), PPP1R12A, CHORDC1, SORL1, EP300 and BRCA2. Interacts with NPM1 and this interaction enhances its activity. Interacts with RAF1. Phosphorylated upon DNA damage, probably by ATM or ATR.Phosphorylation

Post-translational modifications

at Tyr-722 reduces its binding to RHOA and iscrucial for focal adhesion

dynamics. Dephosphorylation by PTPN11stimulates its RHOA binding activity.

Important Note This product as supplied is intended for research use only, not for use in

human, therapeutic or diagnostic applications.

Background Descriptions The protein encoded by this gene is a serine/threonine kinase that regulates

cytokinesis, smooth muscle contraction, the formation of actin stress fibers and focal adhesions, and the activation of the c-fos serum response element. This protein, which is an isozyme of ROCK1 is a target for the small GTPase

Rho. [provided by RefSeq, Jul 2008].

Storage

Store at -20 °C for one year. Avoid repeated freeze/thaw cycles. When reconstituted in sterile pH 7.4 0.01M PBS or diluent of antibody the antibody is stable for at least two weeks at 2-4 °C.

Protein Information

Name ROCK2

Synonyms KIAA0619

Function Protein kinase which is a key regulator of actin cytoskeleton and cell polarity.

Involved in regulation of smooth muscle contraction, actin cytoskeleton organization, stress fiber and focal adhesion formation, neurite retraction, cell adhesion and motility via phosphorylation of ADD1, BRCA2, CNN1, EZR, DPYSL2, EP300, MSN, MYL9/MLC2, NPM1, RDX, PPP1R12A and VIM.

Phosphorylates SORL1 and IRF4. Acts as a negative regulator of VEGF-induced angiogenic endothelial cell activation. Positively regulates the activation of

p42/MAPK1- p44/MAPK3 and of p90RSK/RPS6KA1 during myogenic

differentiation. Plays an important role in the timely initiation of centrosome duplication. Inhibits keratinocyte terminal differentiation. May regulate closure of the eyelids and ventral body wall through organization of actomyosin bundles. Plays a critical role in the regulation of spine and synantic properties in the hippocampus. Plays an important role in generating

synaptic properties in the hippocampus. Plays an important role in generating the circadian rhythm of the aortic myofilament Ca(2+) sensitivity and vascular

contractility by modulating the myosin light chain phosphorylation.

Cellular Location Cytoplasm. Cell membrane; Peripheral membrane protein. Nucleus.

Cytoplasm, cytoskeleton, microtubule organizing center, centrosome

Note=Cytoplasmic, and associated with actin microfilaments and the plasma

membrane.

Tissue Location Expressed in the brain (at protein level).
