## Protein Information

<b>Name</b>	FOXO4
<b>Synonyms</b>	AFX, AFX1, MLLT7
<b>Function</b>	Transcription factor involved in the regulation of the insulin signaling pathway. Binds to insulin-response elements (IREs) and can activate transcription of IGF1. Down-regulates expression of HIF1A and suppresses hypoxia-induced transcriptional activation of HIF1A-modulated genes. Also involved in negative regulation of the cell cycle. Involved in increased proteasome activity in embryonic stem cells (ESCs) by activating expression of PSMD11 in ESCs, leading to enhanced assembly of the 26S proteasome, followed by higher proteasome activity.
<b>Cellular Location</b>	Cytoplasm. Nucleus. Note=When phosphorylated, translocated from nucleus to cytoplasm. Dephosphorylation triggers nuclear translocation. Monoubiquitination increases nuclear localization. When deubiquitinated, translocated from nucleus to cytoplasm

**Tissue Location**

Heart, brain, placenta, lung, liver, skeletal muscle, kidney and pancreas.  
Isoform zeta is most abundant in the liver, kidney, and pancreas

**Background**

Transcription factor involved in the regulation of the insulin signaling pathway. Binds to insulin-response elements (IREs) and can activate transcription of IGFBP1. Down-regulates expression of HIF1A and suppresses hypoxia-induced transcriptional activation of HIF1A-modulated genes. Also involved in negative regulation of the cell cycle. Involved in increased proteasome activity in embryonic stem cells (ESCs) by activating expression of PSMD11 in ESCs, leading to enhanced assembly of the 26S proteasome, followed by higher proteasome activity.

Western Blot analysis of various cells using  
Phospho-FoxO4 (S197) Polyclonal Antibody

Immunohistochemical analysis of paraffin-embedded  
Human brain. Antibody was diluted at  
1:100(4°,overnight). High-pressure and temperature  
Tris-EDTA,pH8.0 was used for antigen retrieval. Negative  
control (right) obtained from antibody was pre-absorbed by  
immunogen peptide.
