Protein Information

Name GPC1

Function Cell surface proteoglycan that bears heparan sulfate. Binds, via the heparan

sulfate side chains, alpha-4 (V) collagen and participates in Schwann cell myelination (By similarity). May act as a catalyst in increasing the rate of conversion of prion protein PRPN(C) to PRNP(Sc) via associating (via the heparan sulfate side chains) with both forms of PRPN, targeting them to lipid rafts and facilitating their interaction. Required for proper skeletal muscle differentiation by sequestering FGF2 in lipid rafts preventing its binding to

receptors (FGFRs) and inhibiting the FGF-mediated signaling.

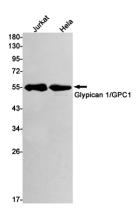

Cellular Location Cell membrane; Lipid-anchor, GPI-anchor; Extracellular side. Endosome.

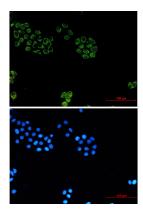

Note=S-nitrosylated form recycled in endosomes. Localizes to

CAV1-containing vesicles close to the cell surface. Cleavage of heparan sulfate side chains takes place mainly in late endosomes. Associates with both forms of PRNP in lipid rafts Colocalizes with APP in perinuclear compartments and

with CP in intracellular compartments. Associates with fibrillar APP amyloid-beta peptides in lipid rafts in Alzheimer disease brains
