Protein Information

Background

UBE2C(Ubiquitin-conjugating enzyme E2 C) is also known as UBCH10 and belongs to the ubiquitin-conjugating enzyme family. It is highly expressed in a variety of human primary tumors, and it is able to promote cell proliferation and malignant transformation (PMID:18703417). UBE2C, along with the E3 ligase of the anaphasepromoting complex (APC), catalyzes the ubiquitination of mitotic cyclins A and B, as well as securin. UBE2C is essential for cell cycle progression, and mutation of its active site cysteine confers a dominant-negative phenotype(PMID:17217624).
