## Protein Information

---

<b>Name</b>	CD46
<b>Synonyms</b>	MCP, MIC10
<b>Function</b>	Acts as a cofactor for complement factor I, a serine protease which protects autologous cells against complement-mediated injury by cleaving C3b and C4b deposited on host tissue. May be involved in the fusion of the spermatozoa with the oocyte during fertilization. Also acts as a costimulatory factor for T-cells which induces the differentiation of CD4+ into T-regulatory 1 cells. T-regulatory 1 cells suppress immune responses by secreting interleukin-10, and therefore are thought to prevent autoimmunity.
<b>Cellular Location</b>	Cytoplasmic vesicle, secretory vesicle, acrosome inner membrane; Single-pass type I membrane protein. Note=Inner acrosomal membrane of spermatozoa. Internalized upon binding of Measles virus, Herpesvirus 6 or Neisseria gonorrhoeae, which results in an increased susceptibility of infected cells to

complement-mediated injury. In cancer cells or cells infected by *Neisseria*, shedding leads to a soluble peptide

**Tissue Location**

Expressed by all cells except erythrocytes.
