#### **Protein Information**

Name CD79B

Synonyms B29, IGB

**Function** Required in cooperation with CD79A for initiation of the signal transduction

cascade activated by the B-cell antigen receptor complex (BCR) which leads to internalization of the complex, trafficking to late endosomes and antigen presentation. Enhances phosphorylation of CD79A, possibly by recruiting kinases which phosphorylate CD79A or by recruiting proteins which bind to

CD79A and protect it from dephosphorylation.

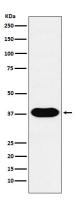

**Cellular Location** Cell membrane; Single-pass type I membrane protein. Note=Following

antigen binding, the BCR has been shown to translocate from

detergent-soluble regions of the cell membrane to lipid rafts although signal

transduction through the complex can also occur outside lipid rafts.
